** Pastureland Estimates - We have chosen to provide the complete Oregon NRI results for all natural resource land cover/use categories, including pastureland, in order to provide a complete "snapshot" of the state. It is important for the data user to recognize that the pastureland conversion estimate for Rural Transportation has a high standard error (100%) and should be used with caution. This type of result may be useful for grouping estimates into broad categories (such as high, medium, and low), but the numerical estimate itself has low reliability.

*** The estimates for total resource lands converted between 1982 and 1992 were derived by adding the urban lands, farmsteads, and rural transportation estimates together. There are no standard error estimates for the 1982 to 1997 total converted lands.

NOTE: Data may not add to totals because of rounding. The error referred to in the table is the standard error of the estimate. You can obtain the margin of error at the 95% confidence limit by multiplying the error by 1.96. Standard errors greater than 50% of the estimate indicate a low level of statistical reliability.
